WPI; 2002-188264/24.

Screening for anti-neoplastic agent involves exposing cells to a agent to be tested for anti-neoplastic activity, and determining in expression of a gene of a signature gene set.

Claim 1; SEQ ID NO 1027; 44pp; English

The present invention describes a method (M1) for screening for neoplastic agent. The method involves exposing cells to a chemic to be tested for anti-neoplastic activity, determining a charge expression of at least one gene (I) of a signature gene set, whe comprises a sequence (S) selected from 8447 sequences (given in . to ABL70110), or is at least 95% identical to (S), where a chang expression is indicative of anti-neoplastic activity. (I) has cyactivity and can be used in gene therapy. M1 can be used for scr anti-neoplastic agent, and can be used for producing a product we the data accollected with respect to the anti-neoplastic agent as of M1, and the data is sufficient to convey the chemical structup properties of the agent. M1 can be used in the treatment of cancerports.

31d that is a 5' expressed sequence tag (5' EST) for 48 and genomic DNAB that correspond to 5'ESTs and for

diagnostic, forensic, gene therapy and chromosome mapping procedu Claim 1; SEQ ID NO 10997; 71pp + Sequence Listing; English.

The present sequence is one of a large number of 5' ESTs derived mRNAs encoding secreted proteins. No ORF has yet been conclusivel identified within the present sequence. The 5' ESTs were prepared total human RNAs or polyA+ RNAs derived from 30 different tissues sequences usually correspond mainly to the 3' untranslated region of the mRNA because they are often obtained from oligo-dT primed libraries. Such ESTs are not well suited for isolating cDNA sequence very from the 5' ends of mRNAs and even in those cases where I cDNA sequences have been obtained, the full 5' UTR is rarely incl ESTs are derived from mRNAs with intext 5' ends and can therefore to obtain full length cDNAs and genomic DNAs. 5' ESTs are also us diagnostic, forensic, gene therapy and chromosome mapping procedu They are used to obtain upstream regulatory sequences and to desi expression and secretion vectors # X W X C C C C C C C C C C C C X W

New polynucleotide sequences obtained from various cDNA libraries as hybridization probes, as oligomers for PCR, for chromosome and mapping, in the recombinant production of protein, or in generatiantisense DNA or RNA.

Claim 1; SEQ ID NO 23899; 44pp; English.

The invention relates to an isolated polynuclectide comprising an 38043 cDNA sequences, appearing as ACH12789-ACH50831, whose seque determined by the technique of SBH (sequencing by hybridisation). Included is a purified polypeptide comprising a sequence correspons reading frame of the novel polynuclectide. The nucleic acid sequence tage in the novel polynuclectide of the nucleic acid sequence tage (BST) for identifying expressed genes or for physical mapping of the human in forensics, in assessing biodiversities, or in identifying muta responsible for genetic disorders and other traits. The nuclectid sequences are also useful as hybridiation probes, as oligomers for chromosome and gene mapping, in the recombinant production of protein, or in generating antisense DNA or RNA. The purified poly is useful for generating antibodies specific for it. The present is one of the 38043 isolated cDNA.Est sequences. Note: The sequence for this patent did not form part of the printed specification, by obtained in electronic format directly from USPTO at segdata.uspto.gov/sequence.html?DocID=20030073623

New isolated nucleic acid that is differentially expressed in car tissues useful for determining the presence of colon cancer in a tissue type, and in antisense therapy.

Claim 1; Fig 1; 796pp; English

ABQ56306 to ABQ60787 represent isolated nucleic acids (I) differe expressed in cancer tissues. ABB7893 to ABB79004 represent prote expressed in cancer tissues. ABB78993 to ABB79004 represent prote encoded by the ABG60776 to ABG60787 unaleic acid sequences. (I) oused in antisense therapy. An antibody immunoreactive with a polyneced by (I) is useful for detecting cancer in a patient sample for detecting the presence or absence of a polynucleotide encoded mucleic acid which hybridises to (I) in a cell. A probe/primer defrom (I) can be used for determining the presence of a nucleic acid which hybridises to (I) is useful for determining the presence of colon cancer in a cell or tissue type, for determining the presence of an early or tissue type, for determining the presence of an acid surface, to identify a chromosome on which corresponding gene resides, and in tissue profilling, forensics, canalysis, mapping and diagnostic applications. (I) can be used to

nd to screen for peptide analogues and antagonists

New Tumor Necrosis Factor family receptor polypeptides and ligand useful for diagnosis and treatment of prostate cancer and develop or gestational abnormalities. 

Example VII; Page 121; 156pp; English.

This invention describes isolated Tumor Necrosis Factor (TNP) fam receptor polypeptides: APO4, APO6, APO8 and APO9 or their active fragments. APO4 is useful for diagnosing prostate can their active fragments. APO4 is useful for diagnosing prostate can receptor polypeptides are also useful for diagnosing prostate can receptor and project as elective binding agents linked to a therapeut moiety. APO4 polypeptides are also useful for identifying selectivations to the polypeptides are also useful for identifying selectivations to the polypeptide/active fragment are also useful for scringers to the polypeptides active fragments are also useful for scring agents to the polypeptides active fragments are also useful for scring agents and antagonists by binding and observing the changer activity. Effective pharmacological agents useful in diagnosis or treatment of disease are also identified using APO4 polypeptides/creatment of activity. The method is performed in vivo or in vitro. APO polypel are all useful as immunogens for preparing antibodies. APO4 is all useful for diagnosis/treatment of developmental or gestational abnormalities. APO8 was transfected to human breast carcinoma cell.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    lymphotoxin homologue designated Apo-3 ligand. Apo-3 ligand has cytostatic activity. Apo-3 ligand can be used to induce apoptosi mammalian cancer cells, to induce NF-kappaB-dependent transcript to induce JNK/SAPK-dependent responses in mammalian cells. The p sequence represents an Apo-3 ligand PCR primer, which is used in example from the present invention

soleic acids encoding PRO polypeptides, useful for treating under tumors, leukemias and lymphoid malignancies, angiogenic and immunologic disorders.

ige 140; 302pp; English.

Nention relates to the isolation of novel human PRO (AAU86128-AAU86162) and the polynucleotide sequences. The PRO POLYpeptides, agonists, antagonists or anti-PRO bladder, breast, etc), leukaemias and lymphoid other disorders such as neuronal, glial, astrocytal, glandular, macrophagal, stromal and blastocoelic disorders, immune and angigenic disorders. The polynucleotide also useful in gene therapy. The present sequence brobe used in the methods of the present invention

The present invention describes a human tumour necrosis factor (T lymphotoxin homologue designated Apo-3 ligand. Apo-3 ligand has eytostatic activity. Apo-3 ligand can be used to induce apoptosis mammalian cancer cells, to induce NF-kappaB-dependent transcripti to induce JNK/SAPK-dependent responses in mammalian cells. The pr sequence represents an Apo-3 ligand PCR primer, which is used in example from the present invention

The invention relates to recombinant carcinoma associated (CA) nadio acid sequences from mouse and human (ADA01482-ADA03094), and to recombinant carcinoma associated proteins (CAP) encoded by them. invention also encompasses expression vectors and host cells common cannot be a protein, and a biochip comprising CA nucleic acid, a polypeptide (sepecially an antibody) that special be protein, and a biochip comprising CA nucleic acid of fragments thereof. The sequences of the invention were identified oncogenic retrovituses, which insert into the genome of the host at random. Many of these do not carry transduced host oncogenes concerning that cancer incident direct consequence of the effects of proviral integration into he protonocogenes. The CA nucleic acid sequences can be used to discarcinoma (especially breast cancer, prostate cancer, lymphoma or leukaemia) or a propensity to carcinoma by determination of the cofficience of a CA gene, or by determination of CA gene expression in particular tissues. CA nucleic acids, proteins and antibodies are also usefi
                        The invention relates to human breast cancer expressed polynucle (AAL07544-AAL26789) and methods of assessing whether a patient is afflicted with breast cancer by examining the correlation betwee expression of certain markers and the cancerous state of breast. The polynucleotides and encoded polypeptides are potential mark detecting, diagnosing, monitoring, characterising treating and polypeptides are also useful for isolating compounds with cytost activity

nucleic acid, useful for treating carcinomas, lymphomas, Lasm, adenocarcinoma, or sarcomas.

ID NO 561; 2304pp; English.

relates to a novel recombinant nucleic acid comprising a guence selected from any of the 660 sequences fully defined lication. A polymucleotide of the invention has cytostatic may have a use in gene therapy, or in a vaccine. The scieic acids and polypeptides are useful for treating 9. lymphomas, cancers, neoplasm, adenocarcinoma, and present sequence represents a mouse cDNA of the invention.

The invention relates to a recombinant nucleic acid comprising a nucleotide sequence selected from any of the fully defined carcin associated (CA) genes from the 50 tables given in the specificati CA proteins are secreted, transmembrane or intracellular proteins recombinant nucleic acids are useful for screening for drug candifor diagnosing or treating carcinomas. Sequences given in ADC8521 ADC85514 represent CA genes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                           New recombinant nucleic acid comprising a nucleotide sequence of the carcinoma-associated (CA) genes, useful for screening for dru candidates for diagnosing or treating carcinomas.
                                                                                                                                  Cytostatic; gene therapy; vaccine; cancer; carcinoma-associated secreted; transmembrane; intracellular; ds.

polynucleotide and encoded polypeptides, useful in forensics, gene mapping, identification of mutations for genetic disorders or other traits and to assess

ID NO 20711; 103pp; English.

n relates to isolated polynucleotide (I) and polypeptide (II)

I) is useful as hybridisation probes, polymerase chain

R) primers, oligomers, and for chromosome and gene mapping, binant production of (II). The polynucleotides are also used as expressed sequence tags for identifying expressed suseful in gene therapy techniques to restore normal (II) or to treat disease states involving (II). (II) is enerating antibodies against it, detecting or quantitating a intissue, as molecular weight markers and as a food (II) and its binding partners are useful in medical imaging ersshing (II). (I) and (II) are useful for treating disorders arrant protein expression or biological activity. The and polymuclocide sequences have applications in forensics, gene mapping, identification of mutations for genetic disorders or other traits to assess biodiversity See other types of data and products dependent on DNA and aguences. AAS64197-AAS94564 represent novel human diagnostic aces of the invention. Note: The sequence data for this ot appear in the printed specification, but was obtained in ormat directly from WIPO at /pub/published\_pot\_sequences

```
The invention relates to recombinant carcinoma associated (CA) national sequences from mouse and human (ADA01482-ADA03094), and to recombinant carcinoma associated proteins (CAP) encoded by them. Invention also encompasses expression vectors and host cells combined to the protein, and a biochip comprising CA nucleic acid of ragments thereof. The sequences of the invention were identified on fragments thereof. The sequences of the invention were identified oncogenic retroviruses, which insert into the genome of the host at random. Many of these do not carry transduced host oncogenes pathogenic retroviruses. The effects of proviral integration into his proposition of the effects of proviral integration into his proposition of the effects of sequences can be used to dia carcinoma (especially breast cancer, prostate cancer, lymphoma on leukaemia) or a propensity to carcinoma by determination of the carcinoma of sequence of the invention. Sorteins and antibodies are also usef therapeutic agents and in screening and evaluating drug candidate present sequence represents a specifically claimed murine CA nucleic sequence of the invention. Note: The complete sequence data for patent did not form part of the printed specification, but was on in electronic format directly from WIPO at
                                                                                                                                                                                          New recombinant nucleic acid encoding carcinoma associated prote useful for preparing compositions for treating carcinomas.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     mouse; ss; cytostatic; gene therapy; vaccine; carcinoma; lymphom

relates to a novel recombinant nucleic acid comprising a quence selected from any of the 660 sequences fully defined ication. A polynucleotide of the invention has cytostatic may have a use in gene therapy, or in a vaccine. The uncleic acids and polypeptides are useful for treating 9. lymphomas, cancers, neoplasm, adenocarcinoma, and present sequence represents a mouse mRNA of the invention.

The invention relates to recombinant carcinoma associated (CA) nu acid sequences from mouse and human (ADA01482-ADA03094), and to recombinant carcinoma associated proteins (CAP) encoded by them. invention also encompasses expression vectors and host cells compound to the protein, and a biochip comprising CA nucleic acid, a polypeptide (especially an antibody) that specification in the protein, and a biochip comprising CA nucleic acid or binds to the protein, and a biochip comprising CA nucleic acid or cogenic retroviruses, which insert into the genome of the host on transportation stransportation into host pathogenic trans-acting viral genes, meaning that cancer incidence direct consequence of the effects of proviral integration into host protooncogenes. The CA nucleic acid sequences can be used to diagnostration (especially breast cancer, prostate cancer, lymphoma or leukaemia) or a propensity to carcinoma by determination of the second tissues. CA nucleic acids, proteins and antibodies are also useful transpertic agents and in screening and evaluating drug candidates remember services. present sequence represents a specifically claimed murine CA nucle sequence of the invention. Note: The complete sequence data for the partent did not form part of the printed specification, but was obtin electronic format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequences.

ant nucleic acid, useful for treating carcinomas, lymphomas, plasm, adenocarcinoma, or sarcomas.

ID NO 559; 2304pp; English.

Trelates to a novel recombinant nucleic acid comprising a aquence selected from any of the 660 sequences fully defined lication. A polymucleotide of the invention has cytostatic may have a use in gene therapy, or in a vaccine. The nucleic acids and polypeptides are useful for treating and polypeptides are useful for treating and licetum and polypeptides are useful for treating and polyments, neoplasm, adenocarcinoma, and present sequence represents a mouse gene of the invention.

The invention relates to a recombinant nucleic acid comprising a nucleotide sequence selected from any of the fully defined carciassociated (CA) genes from the 50 tables given in the specificat CA proteins are secreted, transmembrane or intracellular protein recombinant nucleic acids are useful for screening for drug cand for diagnosing or treating carcinomas. Sequences given in ADC852 ADC85514 represent CA genes of the invention.
                                                                          Cytostatic; gene therapy; vaccine; cancer; carcinoma-associated secreted; transmembrane; intracellular; ds.
                                                                                                                                                                                                                                                                                                                                                               New recombinant nucleic acid comprising a nucleotide sequence the carcinoma-associated (CA) genes, useful for screening for candidates for diagnosing or treating carcinomas.
                                                                                                                                                                                                                                                                                                                                                                                                                           Claim 1; SEQ ID NO 259; 983pp; English

Binds to FN14 and possibly also to TNRFSF12/APO3. Weak fa apoptosis in some cell types. Mediates NP-KappaB n. May promote angiogenesis and the proliferation of cells.

s factor last APO3 ligand superfamily member 12 (TNF-related weak optosis) (TWEAK) (APO3 ligand).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              on of a ligand for the death-domain-containing receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           JAR LOCATION: Type II membrane protein and secreted. PECIFICITY: Highly expressed in adult heart, pancreas, muscle, brain, colon, small intestine, lugg, ovary, spleen, lymph node, appendix and peripheral blood. Tes. Low expression in kidney, testis, liver, placenta, ab bone marrow. Also detected in fetal kidney, liver,
                                                                                                                                                                                                                                                                                                        tazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

Rep. 13:336-342(1995).

FeaA and psaB bind P700, the primary electron donor of tem I (PSI), as well as the electron acceptors A0, A1 and is a plastocyanin/cytcochrome c6-ferredoxin oxidoreductase, ng photonic excitation into a charge separation, which as ne electron from the donor P700 chlorophyll pair to the copically characterized acceptors A0, A1, FX, FA and FB in idized P700 is reduced on the lumenal side of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           d membrane by plastocyanin or cytochrome c6.

2 P700 is a chlorophyll A/chlorophyll A' dimer, A0 is one chlorophyll A, Al is one or both phylloquinones and FX is 4Fe-48 iron-sulfur center (By similarity).

The psaA/B heterodimer binds the P700 chlorophyll special subsequent electron acceptors. PSI consists of a core complex that captures photonns, and an electron transfer at converts photonic excitation into a charge separation. ryotic PSI reaction center is composed of at least 11

```
Fm. J. Phys. Anthropol. 121:67-80(2003).

-!- FUNCTION: Receptor for MSH (alpha, beta and gammA) and ACTH.

-critical entiry of this receptor is mediated by G proteins which act

adenylate cyclase (By similarity).

-!- SUBCELLULAR LOCATION: Integral membrane protein.

-!- SIMILARITY: Belongs to family 1 of G-protein coupled recepto:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This SWISS-PROT entry is copyright. me sequence of the methanogenic archaeon, Methanococcus

The iron-sulfur centers are similar to those of imer of alpha and beta chains (By similarity). 58-1073 (1996). ACTIVITY: Formate + NAD(+) = CO(2) + NADH. Binds 2 4Fe-4S clusters (Probable).

48 ferredoxins. TO THE BETA SUBUNIT OF M.THERMOAUTOTROPHICUM

4Fe-4S

type 4Fe-49

"Genomic organization and polypeptide primary structure of zona pellucida glycoprotein hzp3, the hamster sperm receptor.";

Dev. Biol. 142:414-421(1990).

-!- FUNCTION: Functions as a sperm-receptor. It is responsible for sperm-adhesion to the zona pellucida, and may contribute to the sperm-adhesion to the insemination.

-!- SUBUNIT: ZP3 FORMS WITH ZP1 AND ZP2 THE ZONA PELLUCIDA, IN WHICH ZP2 AND ZP3 COMPLEX INTO COPOLYMERS CROSS-LINKED BY ZP1-
-!- SUBCELLULAR LOCATION: Type I membrane protein. Extracellular

## N.A. (ISOFORM 1).

257; PubMed=12477932;

ACTIVITY: (5-L-glutamyl)-peptide + an amino acid = 5-L-glutamyl-amino acid.

Jeukotriem metabolism; second step.

Heterodimer composed of the light and heavy chains.

Satte is located in the light chain (By similarity).

REDORITON: Type II membrane protein (By similarity).

REPRODUCTS:

ernative splicing; Named isoforms=2;

## 36269-1; Sequence=Displayed;

36269-2; Sequence=VSP\_008146; experimental confirmation available; Y: Belongs to the gamma-glutamyltransferase family. Ref.2 sequence differs from that shown due to a c in position 446. OT entry is copyright. It is produced through a collaboration Swiss Institute of Bloinformatics and the BMBL outstation-Bioinformatics Institute. There are no restrictions on its profit institutions as long as its content is in no way this statement is not removed. Usage by and for commercial ires a license agreement (See http://www.isb-sib.ch/announce/ all to license@isb-sib.ch).
